

# GlideinWMS Overview

FIFE Workshop (June 04, 2013)

- Parag Mhashilkar

- Why GlideinWMS?
- GlideinWMS Architecture
- Summary

# Why GlideinWMS?

## Running Application Workflows -

- **Local Computing Facilities -- Accessible but LIMITED RESOURCES**
  - Familiar setup & interface -- Commonly, Condor Batch System
  - In case of problems, assistance easily accessible
  - ... BUT ...
  - Local clusters maybe limited & busy when you need them
- **Grid Computing -- WILD WILD WEST but Virtually Infinite Resources**
  - Different administrative boundaries
  - Heterogeneous Resources
  - Some sites maintained well compared to others
  - ... BUT ...
  - Large number of opportunistic computing cycles available for use
- **Computing Clouds -- NEW KID IN TOWN**
  - Similar to Grid Sites but well maintained
  - NOT FREE

## GlideinWMS

- Pilot-based WMS that creates *on demand* a *dynamically-sized overlay condor batch system* on Grid & Cloud resources to address the complex needs of VOs in running application workflows

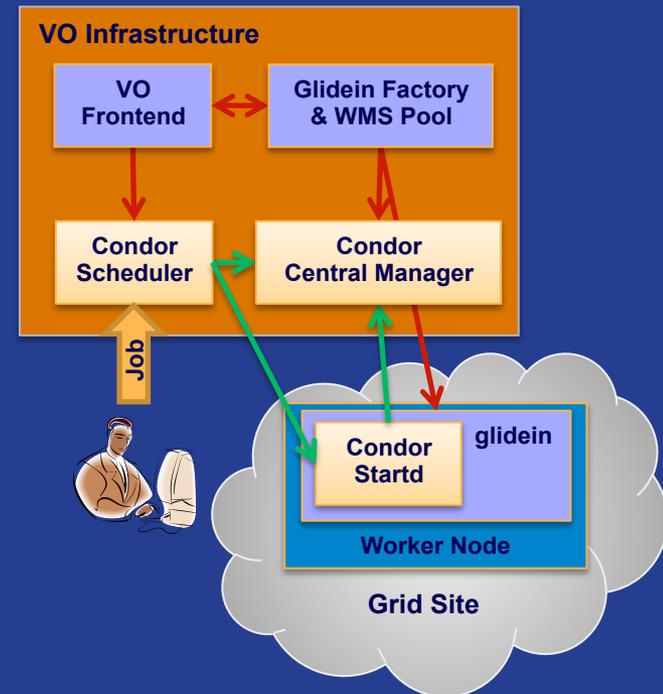

# GlideinWMS Architecture

## Components

1. Glidein Factory & WMS Pool
2. VO Frontend
3. Condor Central Manager & Scheduler

## GlideinWMS in Action

- |                                    |   |   |
|------------------------------------|---|---|
| <i>On Demand</i>                   | } | 1. User submits a job   |
|                                    |   | 2. VO Frontend periodically queries the condor pool and requests factory to submit glideins |
|                                    |   | 3. Factory looks up the requests and submits glideins to WMS Pool                           |
| <i>Dynamically Sized</i>           | } | 4. Glidein starts running on a worker node at a Grid site                                   |
|                                    |   | 5. Glidein performs the required validation and on success starts condor startd             |
| <i>Overlay Condor Batch System</i> | } | 6. Condor startd reports to collector   |
|                                    |   | 7. Job runs on this resource as any other Condor batch job                                  |
|                                    |   | 8. On job completion, glidein exits and relinquishes the worker node                        |

# Simplifying Grids & Clouds for Users

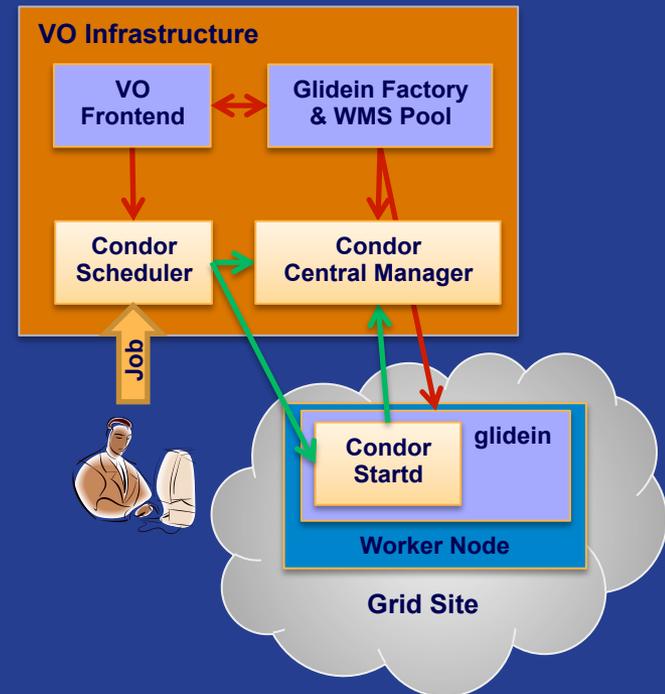

From the User's point of view –

- Users interface to Condor batch system
- Users with existing Condor-ready jobs can submit them to the grid sites and clouds with no or minimal changes
- GlideinWMS shields the user from interfacing directly with the grid sites and clouds
- Glidein validates the node before running a user job; reducing the failure rate of user jobs

From VO's point of view –

- Can prioritize jobs from different users
- Operate VO Frontend service & the Condor Pool (and optionally Glidein Factory + WMS Pool)
- Can use existing Glidein Factories operated by REX@FNAL or OSG

Users focus on Science while operations team support the operations !

# User Community and Releases

- Big user community
  - CMS
  - Run II Experiments : CDF & DZero
  - Intensity Frontier Experiments
  - Cosmic Frontier Experiments
  - Several OSG VOs
    - Centrally administered OSG Glidein factories at UCSD & GOC each supporting 180+ entries
- Releases: Stable and Development Series
  - Production/Stable Series: v2.7 series (Latest release - 2.7.1)
    - Major performance and scaling improvements for the factory to scale with increasing number of entries
  - Development Series: 3.0
    - Releases are *stable but bleeding edge*
    - Version 3.1 to be released **soon**™
      - Beta testing
      - Includes features up to v2.7.1
      - Several enhancements and improved support for Cloud

# Summary

- GlideinWMS
  - Pilot-based WMS
  - Creates on demand & dynamically-sized overlay condor batch system on Grid & Cloud resources
  - Shields users from interfacing directly with the grid sites and clouds by providing condor batch system like interface to the grid/cloud
- Support Mailing list: [glideinwms-support@fnal.gov](mailto:glideinwms-support@fnal.gov)
- <http://www.uscms.org/SoftwareComputing/Grid/WMS/glideinWMS/>
